

Having colored text in the command line is a great help for spotting error or success messages. Unfortunately, those of us developing under Windows do not have this feature by default. Here's how to enable it.

- 1.Download ANSICON from: <https://github.com/adoxa/ansicon/downloads>
- 2.Extract the proper files (Depending on if you have a 32 or 64 bit machine) to c:\ansicon\ (For example). I have a 32 bit machine and hence I extracted the files from inside the x86 folder.
- 3.Open an elevated privilege command line prompt and go to c:\ansicon, and then type "ansicon -i" without the quotes
- 4.Add c:\ansicon to your path environment variable
